

Family Meal Planner - App Summary

Repository evidence snapshot

What it is

A Next.js web app called FamilyTable for shared household meal planning and shopping.

It lets users import recipes from TikTok, Instagram, and websites, then plan meals and generate shopping lists.

Who it is for

Primary persona: household members planning meals and shopping together (inferred from onboarding and UI copy).

What it does

- Recipe library with search/sort/filter, ratings, tags, and recipe editing.
- Recipe import pipeline from URL with JSON-LD/HTML parsing and Playwright fallback when needed.
- Social-caption parsing for Instagram/TikTok recipes, with optional OpenAI extraction.
- Week/month meal planner with recipe entries plus takeaway nights.
- Template support for reusable meal plans (weekly/monthly).
- Shopping-list builder from planned meals, plus Smart List normalization and merge jobs.
- Multi-workspace auth flow with admin workspace/user management and optional Google OAuth.

How it works (repo evidence)

- UI: Next.js App Router pages under app/, with server/client components and Server Actions.
- Data: Prisma ORM to PostgreSQL (workspace, user/session, recipes, plan items, shopping list, smart list jobs).
- Auth: cookie sessions and password login in lib/auth.ts; Google OAuth routes under app/auth/google/.
- Import flow: app/api/import/* triggers lib/scrape/runRecipeImport.ts and lib/scrape/scrapeUrl.ts.
- Smart list flow: app/api/smart-lists/generate queues jobs; app/api/smart-lists/run executes normalization.
- Integrations: OpenAI Responses API for caption/smart-list parsing and Vercel Blob for social image persistence.
- Background worker service: Not found in repo (jobs are kicked off via internal API fetch).

How to run (minimal)

1. Install deps: `pnpm install`
2. Set env vars at minimum: `DATABASE_URL` (required); `OPENAI_API_KEY` and `BLOB_READ_WRITE_TOKEN` are optional
3. Prepare DB schema: `pnpm prisma migrate deploy` (or local equivalent).
4. Start app: `pnpm dev`
5. Open `http://localhost:3000`

Initial database provisioning instructions and sample env file for this app: Not found in repo.
